

\$EMPZ Whitepaper

\$EMPZ is an upcoming token on the Solana blockchain. It is currently planned to launch on the 12th September 2028. As the home of memecoins, Solana is the perfect choice for this project. It excels in a combination of speed, cost, volume, and security in comparison to other blockchains. \$EMPZ will have a total supply of 1,000,000,000 tokens; which is a common practice for memecoins. This supply will be divided into ten groups, which I shall elucidate within this whitepaper.

Firstly, 45% of supply (450,000,000 tokens) will be dedicated to liquidity. This is a huge amount compared to average memecoins, which will ensure lower slippage, so price changes are less volatile. The overarching goal of dedicating such a large portion of supply towards liquidity is to sustain organic activity over time and allow more predictable pricing for traders. This liquidity reserve itself is split into four separate pools:

- **\$SOL** - the native coin of the blockchain and is therefore the most liquid asset available, as well as being among the best performing cryptography-based assets globally.

\$NVDAX - which is a tokenized representation of a NVIDIA Corp stock. NVIDIA stocks are the second best performing asset of all time after Bitcoin and are the biggest asset by market cap after gold.

- **\$USDT** and **\$USDC** - which are both stablecoins pegged to the price of one United States dollar, the world's primary currency reserve. The use of two separate stablecoins increases decentralisation, stability, and liquidity depth.

These liquidity pools will take 15%, 15%, 7.5%, and 7.5% of the supply respectively. This proposed system provides an equal balance between cryptocurrency, stocks, and fiat. The described procedure will ensure price stability during market fluctuations. Therefore, \$EMPZ will not be reliant on a single form of capital.

Each liquidity pool will be hosted on a different DEX (Orca, Raydium, PumpSwap, and Meteora) to reduce dependency on a single service and promote decentralised diversity within the Solana ecosystem. Furthermore, all LP tokens (which normally allow the withdrawal of liquidity funds) will be permanently burned upon pool creation. This ensures that liquidity cannot be removed by the development team, thereby reinforcing long-term trust and stability. Exact details on liquidity pair contracts will be published on creation. Liquidity fee percentages will be based on market predictions at the time and may not be uniform.

Additionally, 190,000,000 tokens are reserved for a burn. This increases \$EMPZ valuation by removing tokens from circulation, and therefore increasing supply/demand. The burn will be split into two separate events of 10% total supply each. This will drop total supply from 1,000,000,000 to 900,000,000 to 810,000,000 periodically, increasing price by an estimated 23%.

Furthermore, 24% of \$EMPZ supply is dedicated towards airdrops in three rounds of 80,000,000 tokens each. These airdrops consist of:

- **Prelaunch Airdrop** - Users will be prompted to sign up for an airdrop via the Empz Economy website for a month prior to token launch. Claims will be monitored based on whether the SOL address is unique, IP activity, and a Cloudflare turnstile. Allocation will be equally divided between all participants.
- **Twitter Airdrop** - @king_empz will post on X (formerly twitter) informing viewers to repost and comment their SOL address to receive an airdrop allocation of \$EMPZ. Allocation will be equally divided between all participants.
- **Random Distribution** - 80,000 random Solana wallets will be selected to receive 1000 \$EMPZ each.

A list of all wallets airdropped will be released after the distribution process. This will not include any identifying information such as IP address or X username.

The final 120,000,000 \$EMPZ tokens are reserved for the developer team. These will be locked for one year after token launch, preventing rug pulls. Please note, this does not prevent Empz Economy volunteers from purchasing \$EMPZ organically from a DEX. These funds will mainly be used as collateral for future development that contributes to the Solana ecosystem as a whole.

All code used will be uploaded to GitHub following token generation.

As a whole, \$EMPZ aims to grow exponentially alongside the entire Solana blockchain and become synonymous with the identity of Solana itself. \$EMPZ shall serve as a currency of freedom; powering a future of electronic decentralised finance. Nevertheless, the company of "Empz Economy" will never enter the public stock exchange. All investments in our brand must come by directly purchasing \$EMPZ from an exchange.
